## Information about Copyrighted Content

Some instruments administered as part of this study may contain in whole or substantially in part contents from copyrighted instruments. Reproductions of the instruments are provided as documentation for the analysis of the data associated with this collection. Restrictions on "fair use" apply to all copyrighted content. More information about the reproduction of copyrighted works by educators and librarians is available from the United States Copyright Office.

### NOTICE

#### WARNING CONCERNING COPYRIGHT RESTRICTIONS

The copyright law of the United States (Title 17, United States Code) governs the making of photocopies or other reproductions of copyrighted material. Under certain conditions specified in the law, libraries and archives are authorized to furnish a photocopy or other reproduction. One of these specified conditions is that the photocopy or reproduction is not to be "used for any purpose other than private study, scholarship, or research." If a user makes a request for, or later uses, a photocopy or reproduction for purposes in excess of "fair use," that user may be liable for copyright infringement.

# DESCRIPTION OF THE NATIONAL MENTAL HEALTH SERVICES SURVEY (N-MHSS)

This report presents findings from the 2010 National Mental Health Services Survey (N-MHSS) conducted from June 2010 through January 2011 with a reference date of April 30, 2010. The N-MHSS collects information from all known facilities<sup>1</sup> in the United States, both public and private, that provide mental health treatment services to persons with mental illness.

The N-MHSS is designed to collect data on the location, characteristics, and utilization of organized mental health treatment service providers throughout the 50 States, the District of Columbia, and the U.S. territories. The survey obtains basic data on the number and characteristics of these specialty mental health treatment service providers and the persons they serve.

The N-MHSS is the *only* source of national and State-level data on the mental health services delivery system reported by both publicly-operated and privately-operated specialty mental health care facilities. The N-MHSS complements, but does not duplicate, the information collected through SAMHSA's survey of substance abuse treatment facilities, the National Survey of Substance Abuse Treatment Services (N-SSATS).

The N-MHSS provides the mechanism for quantifying the dynamic character and composition of the U.S. mental health treatment delivery system. The objective of the N-MHSS is to collect data that can be used for multiple purposes:

- To assist SAMHSA and State and local governments in assessing the nature and extent of services provided in State-funded, State-operated, and other mental health treatment facilities, and in forecasting mental health treatment resource requirements;
- To update SAMHSA's Inventory of Behavioral Health Services (I-BHS), an inventory of all known mental health and substance abuse treatment facilities in the United States, which can be used as a frame for future surveys of these facilities;
- To describe the nature and scope of mental health treatment services and conduct comparative analyses for the nation and States; and

---

<sup>1</sup> In this report, entities responding to the N-MHSS are referred to as "facilities." Chapter 1, page 3, *Survey coverage* provides definitions of the types of mental health treatment facilities included in the N-MHSS.

To update the information in the mental health component of SAMHSA's online Behavioral Health Treatment Services Locator, a searchable database of licensed and accredited public and private facilities for the provision of mental health treatment. The Facility Locator is available on the Internet at <http://findtreatment.samhsa.gov>.

### **Highlights of the Data**

- Most (77 percent) mental health treatment facilities were privately operated.
- Most clients in mental health treatment facilities received services in outpatient care settings.
- The number of beds reported to be designated for hospital inpatient treatment was 113,569 and the number of beds reported to be designated for residential treatment was 68,053.
- Most mental health treatment facilities offered exclusively designed treatment programs or groups for adults with serious mental illness (63 percent) and for individuals with co-occurring mental health and substance abuse disorders (58 percent).
- Over 90 percent of psychiatric hospitals, general hospitals with a separate psychiatric unit, and U.S. Department of Veterans Affairs medical centers provided psychotropic medication therapy.
- Over half of mental health treatment facilities (58 percent) reported that they employ a crisis intervention team to handle acute mental health issues.
- Most mental health treatment facilities indicated that they accepted Medicaid for payment of services (88 percent) and most indicated that they accepted Medicare for payment of services (69 percent).
- Mental health treatment facilities reported that 99,493 clients received 24-hour inpatient treatment services on April 30, 2010; 60,764 clients received 24-hour residential treatment services on April 30, 2010; and 3,026,379 active clients still enrolled in treatment as of April 30, 2010 received less than 24-hour outpatient treatment services.
- Of the total number of clients in mental health treatment facilities, males accounted for 59 percent of persons receiving inpatient care; 69 percent of persons receiving residential care; and 49 percent of persons receiving outpatient care.
- Among clients who received 24-hour hospital inpatient mental health treatment services, 21 percent were under age 18; 68 percent were age 18 to 64; and 11 percent were age 65 and older. Among clients who received 24-hour residential mental health treatment services, 53 percent were under age 18; 42 percent were age 18 to 64; and 6 percent were age 65 and older. Among clients who received less than 24-hour outpatient mental health treatment services, 28 percent were under age 18; 65 percent were age 18 to 64; and 8 percent were age 65 and older.

- Of the total number of clients enrolled in mental health treatment services on April 30, 2010, an estimated 19 percent had diagnosed co-occurring mental health and substance abuse disorders.

## **Data Collection Procedures for the 2010 N-MHSS**

### *Field period and reference date*

The field period for the 2010 N-MHSS ran from June 11, 2010, through January 27, 2011. The survey reference date was April 30, 2010.

### *Survey universe*

The initial N-MHSS universe of 15,562 facilities (Appendix A) included all known specialty mental health facilities in the United States and its territories at the beginning of the data collection period. Most facilities in the 2010 N-MHSS frame were identified from a 2008 SAMHSA database. To enhance the existing SAMHSA database of eligible facilities, a list of currently-operating mental health treatment facilities was requested from the Centers for Medicare and Medicaid Services (CMS) and national professional organizations. These entities provided information for additional mental health facilities that were added to the initial survey frame. A small number of newly identified facilities was added to the survey frame over the course of the 2010 N-MHSS. The final total N-MHSS facility universe was 16,197 mental health treatment facilities.

### *Survey coverage*

The following types of mental health treatment facilities were included in the 2010 N-MHSS:

*Psychiatric hospitals*—Facilities licensed and operated as state/public psychiatric hospitals or as state-licensed private psychiatric hospitals that primarily provide 24-hour inpatient care to persons with mental illness. They may also provide 24-hour residential care and/or less than 24-hour care (i.e., outpatient, partial hospitalization), but these additional service settings are not requirements.

*Non-federal general hospitals with a separate psychiatric unit*—Licensed general hospitals (public or private) that provide inpatient mental health services in separate psychiatric units. These units must have specifically allocated staff and space for the treatment of persons with mental illness. The units may be located in the hospital itself or in a separate building that is owned by the hospital.

*VA medical centers*—Facilities operated by the U.S. Department of Veterans Affairs, including general hospitals with separate psychiatric inpatient units, and/or residential treatment programs, and/or psychiatric out-patient clinics.

*Outpatient or day treatment or partial hospitalization mental health facilities*—Facilities that (1) provide only outpatient mental health services to ambulatory clients, typically for less than

three hours at a single visit or (2) provide only partial day mental health services to ambulatory clients, typically in sessions of three or more hours on a regular schedule. A psychiatrist generally assumes the medical responsibility for all clients and/or for the direction of their mental health treatment. Throughout this report (text and tables), these facilities will be referred to as *outpatient clinics*.

*Residential treatment centers (RTCs) for children*—Facilities not licensed as psychiatric hospitals that primarily provide individually-planned programs of mental health treatment in a residential care setting for children under age 18. (Some RTCs for children may also treat young adults.) RTCs for children must have a clinical program that is directed by a psychiatrist, psychologist, social worker, or psychiatric nurse who has a master's or doctoral degree. To qualify as an RTC, the primary reason for admission of more than half of the clients must be mental illness or emotional disturbance that can be classified by DSM-III/DSM-III-R, DSM-IV/DSM-IV-TR, or ICD-9-CM/ICD-10-CM codes, other than codes for mental retardation, developmental disorders, and substance use disorders.

*Residential treatment centers (RTCs) for adults*—Facilities not licensed as psychiatric hospitals that primarily provide individually-planned programs of mental health treatment in a residential care setting for adults.

*Multi-setting (multi-service, non-hospital) mental health facilities*—Facilities that provide residential and outpatient mental health services and are not classified as psychiatric or general hospitals with a separate psychiatric unit or as RTCs.

### *Exclusions*

The 2010 N-MHSS survey universe excluded Department of Defense military treatment facilities, Indian Health Service-administered or tribally-operated facilities, private practitioners or small group practices not licensed as a mental health clinic or center, and jails or prisons.

### *Content*

The 2010 N-MHSS survey instrument was a 10-page document with 36 numbered questions. Topics included:

Facility type, operation, and primary treatment focus

Facility treatment characteristics (e.g., settings of care; mental health treatment approaches, supportive services/practices, and special programs offered; crisis intervention team availability; and seclusion and restraint practices)

Facility operating characteristics (e.g., age groups accepted; services provided in non-English languages; and smoking policy)

Facility management characteristics (e.g., computerized functionality; licensure, certification, and accreditation; standard operating procedures; and sources of payment and funding)

## Client demographic characteristics

### *Data collection*

Three data collection modes were employed: a secure web-based questionnaire, a paper questionnaire sent by mail, and a computer-assisted telephone interview (CATI). Initially, respondents could select either the web-based or paper mode to complete the survey. Approximately two weeks before the survey reference date (April 30, 2010), an advance letter from SAMHSA was mailed to the attention of the facility directors of all eligible facilities to alert them to expect the survey and to request their participation in the N-MHSS (Appendix A). The letter also served to update records with new address information received from the U.S. Postal Service. A data collection packet (including the questionnaire, SAMHSA cover letter, definition package, State-specific letter of support, information on completing the survey on the web, fact sheet of Frequently Asked Questions, and postage-paid business-reply envelope) was mailed to each facility in June 2010. The web-based survey also became available in June. Each facility had the option of completing the paper questionnaire and returning it by mail or completing the questionnaire via the secure survey website.

During the data collection phase, contract personnel were available by telephone to answer facilities' questions concerning the survey. Web-based support for facilities completing the questionnaire on the web was also available. Multiple reminder letters were sent to non-respondents over the course of the data collection period via fax, mail, and email. To increase the survey response rate, State mental health agency representatives were contacted during the data collection period to inform them of their State's progress and to request additional help in encouraging responses. CATI follow-up of non-respondents began in late September 2010 and ended in late December.

### *Eligibility and unit response rate*

Table 1.1 presents a summary of eligibility and response rate information. Of the 16,197 mental health treatment facilities in the survey, 24.8 percent were found to be ineligible for the survey because they did not provide mental health treatment services, had a primary treatment focus of substance abuse services or general health care, provided treatment for incarcerated persons only (i.e., in jails or prisons), or were an individual or small group mental health practice not licensed or certified as a mental health center or clinic.

**Table 1.1. N-MHSS facilities, by status and mode of response: 2010**

	Number	Percent
<b>Total facilities in survey</b>	<b>16,197</b>	<b>100.0</b>
Closed/ineligible	4,011	24.8
Eligible	12,186	75.2
<b>Total eligible</b>	<b>12,186</b>	<b>100.0</b>

	Number	Percent
Non-respondents	1,068	8.8
Respondents	11,118	91.2
Excluded from report <sup>1</sup>	693	6.2
Uncategorized roll-ups <sup>2</sup>	51	0.5
Included in report	10,374	93.3
<b>Mode of response</b>	<b>10,374</b>	<b>100.0</b>
Internet	5,538	53.4
Mail	2,535	24.4
Telephone	2,301	22.2

<sup>1</sup> Facilities excluded from this report include 692 administrative-only facilities and one facility reporting a facility type of “other” in question A5.

<sup>2</sup> Facilities whose client counts were included in or “rolled into” other facilities’ counts and whose facility characteristics were not reported separately.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, 2010 National Mental Health Services Survey (N-MHSS).

Ninety-one percent of the 12,186 eligible facilities completed the survey, including 692 facilities that provided administrative services only. Half of the respondents (53.4 percent) completed the survey on the web, 24.4 percent through the mail, and 22.2 percent on the telephone.

## Quality Assurance

All mail questionnaires underwent a manual review for consistency and missing data. Calls to facilities clarified questionable responses and obtained missing data. After data entry, automated quality assurance reviews were conducted. The reviews incorporated the rules used in manual editing plus consistency checks not readily identified by manual review. The web-based questionnaire was programmed to be self-editing; that is, respondents were prompted to complete missing responses and to confirm or correct inconsistent responses on critical items. The CATI questionnaire was similarly programmed.

## Facility Reporting and Selection for the 2010 N-MHSS Report

*Table 1.1.* Among the 11,118 eligible respondents, 693 provided information but were deemed out-of-scope, and thus excluded from the analyses in this report. The excluded facilities and reasons for exclusion fell into two categories:

The number of facilities that provided only administrative services totaled 692. These facilities are included in SAMHSA’s online Behavioral Health Treatment Services Locator; however, given that these facilities do not provide mental health treatment services, they are considered out-of-scope for this report.

One facility reported a facility type as “other” and could not be categorized into one of the remaining six categories. This facility is considered out-of-scope for this report.

An additional 51 facilities whose client counts were included in or “rolled into” other facilities’ counts and whose facility characteristics were not reported separately were excluded from facility counts in this report’s Chapter 2 and Chapter 4 tables. However, their client counts are included in this report’s Chapter 3 tables.

After the exclusion of the 693 out-of-scope facilities and 51 rolled-up facilities, data from 10,374 eligible respondent facilities were included in this 2010 N-MHSS report.

#### *Number of respondents reporting facility and client data*

The number of eligible respondents to the 2010 N-MHSS that reported data totaled 10,374. Of the 10,374 facilities in the N-MHSS, basic facility information, service characteristics, and client counts were reported for 9,139 facilities. The remaining 1,235 facilities are excluded from Chapter 2 tables since their service characteristics were not reported. The breakdown of facility data and client counts reported by respondents is summarized below.

9,139 facilities:

7,107 facilities reported basic facility information, service characteristics, and client counts for their own facility.

645 facilities reported basic facility information and service characteristics for themselves and provided client counts for their own facility and other facilities.

1,387 facilities reported basic facility information and service characteristics for their own facility. Their client counts were provided by another facility.

1,235 facilities:

366 facilities reported basic facility information and client counts for their own facility.

47 facilities reported basic facility information and client counts for their own facility and other facilities.

822 facilities reported basic facility information for their own facility. Their client counts were provided by another facility.

#### **Item Non-Response**

Extensive follow-up during data collection and careful editing minimized item non-response. Thus, resulting item response rates were generally high, averaging approximately 98 percent across all 149 separate items. The average item response rate for items excluding demographic

client counts in questions 3b, 4b, and 5b was approximately 99 percent.<sup>2</sup> The average item response rate for demographic items was lower, averaging approximately 85 percent.

### **Data Considerations and Limitations**

As with any data collection effort, certain procedural considerations and data limitations must be taken into account when interpreting data from the 2010 N-MHSS. Some general issues are listed below. Considerations and limitations of specific data items are discussed where the data are presented.

The N-MHSS attempts to obtain responses from all known mental health treatment facilities, but it is a voluntary survey. There was no adjustment for the 8.8 percent facility non-response.

The N-MHSS is a point-prevalence survey. It provides information on the mental health treatment system and its clients as of a pre-selected reference date (April 30, 2010). Client counts reported here do not represent annual totals. Rather, the N-MHSS provides a “snapshot” of mental health treatment facilities and clients on an average day or month.

Multiple responses were allowed for certain questionnaire items (for example, mental health treatment approaches offered and functions that are computerized). Tabulations of data for these items include the total number of facilities reporting each response category.

---

<sup>2</sup> Only one item (question B8: *What percent of the admissions reported in question B7 (MHAdmissions) above were military veterans?*) had a response rate below 90 percent.

## SETTINGOP: QA3\_3 Mental health treatment offered in outpatient (or day treatment/partial hospitalization) setting

A3. In which of these settings are mental health treatment services offered at this facility, at this location?

3. Outpatient, day treatment or partial hospitalization services (less than 24-hour, not overnight, ambulatory outpatient counseling, day treatment or partial hospitalization)

Value	Label	Unweighted Frequency	%
0	No	2443	23.5 %
1	Yes	7931	76.5 %
	Missing Data		
	Total	10,374	100%

Based upon 10,374 valid cases out of 10,374 total cases.

- Minimum: 0
- Maximum: 1

Location: 36-38 (width: 3; decimal: 0)

Variable Type: numeric

(Range of) Missing Values: -9 , -6 , -1

## FACILITYTYPE: QA5 Facility type

A5. Which ONE category best describes this facility, at this location?

Value	Label	Unweighted Frequency	%
1	Psychiatric Hospital	658	6.3 %
2	Separate inpatient psychiatric unit of a general hospital	1238	11.9 %
3	Residential treatment center for children	781	7.5 %
4	Residential treatment center for adults	878	8.5 %
5	Outpatient, day treatment or partial hospitalization mental health facility	6468	62.3 %
6	Multi-setting (non-hospital) mental health facility	351	3.4 %
	Missing Data		
	Total	10,374	100%

Based upon 10,374 valid cases out of 10,374 total cases.

- Minimum: 1
- Maximum: 6

Location: 39-41 (width: 3; decimal: 0)

Variable Type: numeric  
(Range of Missing Values: -9 , -6 , -1

## FOCUS: QA6 Primary treatment focus

A6. What is the primary treatment focus of this facility, at this location?

Value	Label	Unweighted Frequency	%
1	Mental health services	7287	70.2 %
3	Mix of mental health and substance abuse	2457	23.7 %
	<b>Missing Data</b>		
-1	UNKNOWN	630	6.1 %
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 9,744 valid cases out of 10,374 total cases.

- Minimum: 1
- Maximum: 3

Location: 42-44 (width: 3; decimal: 0)  
Variable Type: numeric  
(Range of Missing Values: -9 , -6 , -1

## OWNERSHIP: QA7 Facility is operated by

A7. Is this facility operated by ... ?

Value	Label	Unweighted Frequency	%
1	Private for-profit organization	996	9.6 %
2	Private non-profit organization	6968	67.2 %
3	State mental health agency (SMHA)	727	7.0 %
5	Other State government	274	2.6 %
6	Regional or district authority	191	1.8 %
7	Local, county, or municipal government	953	9.2 %
8	U.S Department of Veterans Affairs	252	2.4 %
9	Other	13	0.1 %
	<b>Missing Data</b>		
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 10,374 valid cases out of 10,374 total cases.

- Minimum: 1
- Maximum: 9

Location: 45-47 (width: 3; decimal: 0)  
Variable Type: numeric  
(Range of Missing Values: -9 , -6 , -1

## RELIGIOUS: QA8 Facility is affiliated with a religious organization

A8. Is this facility affiliated with a religious organization?

Value	Label	Unweighted Frequency	%
0	No	8876	85.6 %
1	Yes	816	7.9 %
	<b>Missing Data</b>		
-1	UNKNOWN	682	6.6 %
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 9,692 valid cases out of 10,374 total cases.

- Minimum: 0
- Maximum: 1

*Location:* 48-50 (width: 3; decimal: 0)

*Variable Type:* numeric

*(Range of) Missing Values:* -9 , -6 , -1

---

## TREATACTVITYTHRPY: QA10\_1 Facility offers activity therapy

A10. Which of these mental health treatment approaches are offered at this facility, at this location?

(1) Activity therapy

Value	Label	Unweighted Frequency	%
0	No	4401	42.4 %
1	Yes	4676	45.1 %
	<b>Missing Data</b>		
-1	UNKNOWN	1297	12.5 %
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 9,077 valid cases out of 10,374 total cases.

- Minimum: 0
- Maximum: 1

*Location:* 51-53 (width: 3; decimal: 0)

*Variable Type:* numeric

*(Range of) Missing Values:* -9 , -6 , -1

---

## TREATBEHAVMOD: QA10\_2 Facility offers behavior modification

A10. Which of these mental health treatment approaches are offered at this facility, at this location?

(2) Behavior modification

Value	Label	Unweighted Frequency	%
0	No	3130	30.2 %
1	Yes	5950	57.4 %
	<b>Missing Data</b>		
-1	UNKNOWN	1294	12.5 %
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 9,080 valid cases out of 10,374 total cases.

- Minimum: 0
- Maximum: 1

*Location:* 54-56 (width: 3; decimal: 0)

*Variable Type:* numeric

*(Range of) Missing Values:* -9 , -6 , -1

---

### TREATCOGTHRPY: QA10\_3 Facility offers cognitive/behavioral therapy

A10. Which of these mental health treatment approaches are offered at this facility, at this location?

(3) Cognitive/behavioral therapy

Value	Label	Unweighted Frequency	%
0	No	1022	9.9 %
1	Yes	8061	77.7 %
	<b>Missing Data</b>		
-1	UNKNOWN	1291	12.4 %
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 9,083 valid cases out of 10,374 total cases.

- Minimum: 0
- Maximum: 1

*Location:* 57-59 (width: 3; decimal: 0)

*Variable Type:* numeric

*(Range of) Missing Values:* -9 , -6 , -1

---

### TREATFAMTHRPY: QA10\_4 Facility offers couples/family therapy

A10. Which of these mental health treatment approaches are offered at this facility, at this location?

(4) Couples/family therapy

Value	Label	Unweighted Frequency	%
0	No	2952	28.5 %
1	Yes	6129	59.1 %
	<b>Missing Data</b>		
-1	UNKNOWN	1293	12.5 %
	<b>Total</b>	<b>10,374</b>	<b>100%</b>

Based upon 9,081 valid cases out of 10,374 total cases.

- Minimum: 0
- Maximum: 1

*Location:* 60-62 (width: 3; decimal: 0)

*Variable Type:* numeric

*(Range of) Missing Values:* -9 , -6 , -1

---

## TREATELECTRO: QA10\_5 Facility offers electroconvulsive therapy

A10. Which of these mental health treatment approaches are offered at this facility, at this location?

(5) Electroconvulsive therapy

Value	Label	Unweighted Frequency	%
0	No	8459	81.5 %
1	Yes	573	5.5 %
	<b>Missing Data</b>		
-1	UNKNOWN	1342	12.9 %

## APPENDICES

# Appendix A

## Data Collection Procedures

## DATA COLLECTION PROCEDURES

### Survey Frame

The survey frame for the 2010 N-MHSS originally consisted of 15,562 known mental health facilities. Of these 15,562 facilities, most were identified from the National Survey of Mental Health Treatment Facilities (NSMHTF) conducted by SAMHSA in 2008. The Centers for Medicare and Medicaid Services (CMS) and various national professional organizations provided additional lists of currently operating mental health facilities to supplement the initial survey frame. During data collection, an additional 635 facilities were identified that were previously unknown to SAMHSA. The final survey frame consisted of 16,197 facilities.

### Data Collection

Data collection took place between June 11, 2010, and January 27, 2011. During that period, facilities were contacted through mail, email, fax, and telephone to remind them to complete the survey. Facilities whose client counts were provided by another facility (roll-up facilities) were contacted between May 25, 2011, and June 15, 2011, to collect minimal information on facility characteristics. Of the total 16,197 facilities included in the survey frame, 4,011 (24.8 percent) were closed or ineligible. Ineligible facilities included those that did not provide mental health treatment, were a satellite site,<sup>1</sup> focused primarily on substance abuse treatment or general health care, provided treatment only for incarcerated persons in jail or prison, or were an individual or small group mental health practice not licensed or certified as a mental health clinic or center. Table B.1 provides a full break-down of closed and ineligible facilities.

---

<sup>1</sup> A satellite site is a mental health treatment facility without permanent staff of its own. Staff from another facility visit the satellite site (usually on a regular schedule) to provide treatment.

**Table B.1. N-MHSS facilities, by eligibility: 2010**

	Number	Percent
<b>Total facilities in survey</b>	<b>16,197</b>	<b>100.0</b>

## Appendix B

Methodology for unrolling Client Counts to “Child” Facilities

## **METHODOLOGY FOR UNROLLING CLIENT COUNTS TO “CHILD” FACILITIES**

In the 2010 N-MHSS, facilities had the option to (1) report client counts for each of three service settings (inpatient [IP], residential [RC], and outpatient [OP]) for their facility only; (2) report client counts for their facility plus additional facilities; or (3) rely on another facility to report client counts for them. A “self-reported facility” reported client counts for only itself. A “parent facility” reported client counts for other facilities in addition to itself. A “child facility” relied on a “parent facility” to report its client counts. The parent facility together with its child facilities is a “family” of facilities. Client counts reported by a parent facility needed to be distributed (“unrolled”) among the family of facilities.

For a family of facilities, the total client count in each service setting is known (variables B3a: IP-Total; B4a: RCTotal; B5a: OPTotal). The service setting(s) offered by each facility within a family is also known (variable A3: SettingIP, SettingRC, SettingOP). The problem lies in how to distribute total client counts among the facilities.

To unroll client counts to several facilities within a family of facilities, an empirical distribution of client counts by service type (IP, RC, or OP) was used conditional on variables believed to influence that distribution. The variables are identified in Table C.1.

**Table C.1. Variables thought to influence the distribution of client counts by service type and used to unroll client counts: 2010**

Setting (seven levels):	1 IP only 2 OP only 3 RC only 4 IP + RC 5 IP + OP 6 RC + OP 7 IP + RC + OP
Region (four levels):	1 Northeast 2 Midwest 3 South 4 West
Ownership <sup>1</sup> (seven levels):	1 Private for-profit organization 2 Private non-profit organization 3 State mental health agency 5 Other state government, excluding department of corrections or juvenile justice 6 Regional or district authority; local, county, or municipal government 7 U.S. Dept. of Veterans Affairs 8 Other
Facility Type (seven levels):	1 Psychiatric hospitals 2 General hospitals with a separate psychiatric unit 3 Residential treatment centers for children 4 Residential treatment centers for adults 5 Outpatient, or day treatment, or partial hospitalization mental health facilities 6 Multi-setting (non-hospital) mental health facilities 7 Other facilities

<sup>1</sup> Facilities indicating that they were operated by a “state department of corrections or juvenile justice” were assigned an ownership value of 4, but these facilities are ineligible and therefore not included in the unrolling process.

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, 2010 National Mental Health Services Survey (N-MHSS).

For a family of facilities, proportions from the conditional distribution were used to distribute client counts by service type.

Given that combinations of the four variables resulted in a large number of cells with sparse counts/proportions, combinations of the four variables were reclassified by using a “decision tree” technique. Chi-squared Automatic Interaction Detection (CHAID)<sup>2</sup> was performed using the Statistical Program for the Social Sciences (SPSS) software, Answer Tree.

<sup>2</sup> Exhaustive CHAID was also performed, which uses more merges and testing of the input variables and considers all possible combinations. The main goal of the Exhaustive CHAID is to leave only two groups for each branch of the tree. Whereas the Exhaustive CHAID is generally more thorough, it tends to create small nodes. Therefore, to prevent small cell variability, it was decided to use the normal CHAID.

CHAID partitions the data into mutually exclusive, exhaustive subsets that best describe the dependent variables (Kass 1980). The subsets are constructed by using small groups of predictors. The selected predictors may then be used in further analysis, such as the prediction of a dependent variable. The analysis produces a classification tree that shows the merges of any allowable pair of categories of the predictor variable if there is no statistically significant difference within the pair with respect to the target variable. The process repeats until it finds no nonsignificant pair. It first selects the variable with the strongest correlation with client counts and then subdivides the variable into separate levels according to its resulting classification. To prevent groupings of the setting variable, it was made the first variable in the tree.

The 7,412 facilities that originally self-reported their client counts<sup>3</sup> were used to calculate the proportion of clients in each service setting in a facility. For example, the proportion of 24-hour hospital inpatient clients at a facility is equal to:

$$\text{Proportion of } IPTotal = \frac{IPTotal(QB3a)}{IPTotal(QB3a) + RCTotal(QB4a) + OPTotal(QB5a)}$$

where *IPTotal* is the variable in the 2010 N-MHSS dataset corresponding to the number of 24-hour hospital inpatient clients in a facility, *RCTotal* is the variable corresponding to the number of 24-hour residential clients in a facility, and *OPTotal* is the variable corresponding to the number of outpatient clients in a facility.

Within each CHAID group defined in Table C.2, the average of the facility proportions of clients in each service setting was calculated, which represents the distribution of services offered conditional on the group. Table C.2 presents the resulting groups and proportions.

---

<sup>3</sup> A total of 7,412 facilities originally reported actual clients counts for themselves. An additional 62 facilities neither provided client counts for themselves nor had their client counts reported for them by another facility. The client counts were imputed for these 62 facilities, so while they are considered “self-reporting facilities,” they were not used in calculating the proportions developed for the unrolling process. After the unrolling and imputation processes were completed, one facility with facility type reported as “other” in Question A5 was removed because it could not be classified into one of the six categories in Question A5. Therefore, there are a total of 7,473 “self-reporting facilities” in the final 2010 N-MHSS analysis data set.

**Table C.2. Definition of CHAID groups and their conditional proportions: 2010**

Group	Facilities grouping				Conditional proportion		
	Setting	Ownership	Region	Facility Type	IPTotal	RCTotal	OPTotal
1	1	ALL	ALL	ALL	1.0	0.0	0.0
2	5	ALL	2,3	2	0.12	0.0	0.87
3	5	ALL	2,3	1,5	0.14	0.0	0.86
4	5	ALL	1,4	2,5	0.04	0.0	0.96
5	5	ALL	1,4	1	0.18	0.0	0.82
6	7	3,5,6,7,8,9	ALL	ALL	0.03	0.03	0.94
7	7	1,2	ALL	ALL	0.13	0.07	0.80
8	4	ALL	ALL	ALL	0.59	0.41	0.0
9	3	ALL	ALL	ALL	0.0	1.0	0.0
10	6	ALL	ALL	2,4	0.0	0.26	0.73
11	6	ALL	1,2,3	5,6	0.0	0.05	0.95
12	6	ALL	4	5,6	0.0	0.09	0.91
13	6	ALL	ALL	3	0.0	0.40	0.59
14	2	ALL	ALL	ALL	0.0	0.0	1.0

SOURCE: Center for Behavioral Health Statistics and Quality, Substance Abuse and Mental Health Services Administration, 2010 National Mental Health Services Survey (N-MHSS).

An example best illustrates how to use Table C.2 to distribute/unroll parent facility client counts to the family of facilities: if a parent facility reported 60 inpatient clients, 300 residential clients, and 550 outpatient clients and indicated that they were reporting for three facilities, then the parent facility client counts needed to be distributed among three facilities: A, B, and C. Facility A offers all three service settings (Setting = 7); facility B offers RC and OP service settings (Setting = 6); and facility C offers only the OP service setting (Setting = 2). All three facilities are operated by a private non-profit organization (Ownership = 2), are located in New York (Region = 1), and are multi-setting facilities (Facility Type = 6). Drawing on the information in Table C.2, the following proportions are used to unroll the parent client counts to the three facilities:

	Service setting type		
	Inpatient	Residential	Outpatient
Parent Count	60	300	550
Facility A (Group = 7)	0.13	0.07	0.80
Facility B (Group = 11)	0.00	0.05	0.95
Facility C (Group = 14)	0.00	0.00	1.00
Sum of proportions	0.13	0.12	2.75

First, the proportions in each column are divided by the sum of these proportions, giving the following:

	Service setting type		
	Inpatient	Residential	Outpatient
Parent Count	60	300	550
Facility A (Group = 7)	1.00	0.59	0.29
Facility B (Group = 11)	0.00	0.41	0.35
Facility C (Group = 14)	0.00	0.00	0.36

These proportions are then multiplied by the parent facility's counts for *IPTotal*, *RCTotal*, and *OPTotal* to distribute the client counts for each setting to the family of facilities. In this example, the counts are as follows:

	Inpatient	Residential	Outpatient	Facility total
Parent Count	60	300	550	910
Facility A (Group = 7)	60	177	160	397
Facility B (Group = 11)	0	123	190	313
Facility C (Group = 14)	0	0	200	200

## Appendix C

### Item Response Rates

## ITEM RESPONSE RATES

To assess the magnitude of item missing data within the facility responses collected in the 2010 N-MHSS, a response rate was calculated for each of the items,  $RR_{item\ i}$ , as:

$$RR_{item\ i} = \frac{\text{Number of eligible units responding to item } i}{\text{Number of units eligible to respond to item } i}$$

In Tables D.1 and D.2, respectively, the item response rates are presented for demographic item groups and for nondemographic items. The item response rates in Table D.2 are presented in alphabetical order by variable name.

The item response rates for demographic item groups (gender, age, ethnicity, race, and legal status for inpatient (question B3b), residential (question B4b), and outpatient (question B5b) settings) needed to be calculated differently than other items. For each service setting (inpatient, residential, or outpatient), item response rates were calculated for a demographic “group,” such as gender, and not separately for each item in the group (males, females). For example, for the gender group, the criterion used to calculate the number of facilities in the numerator of the gender item response rate calculation was based on satisfying either of the following two conditions:

- The sum of the reported percentage for each of the subcategories of the gender variable (percentage of males and percentage of females) was equal to 100 percent.
- The sum of the counts reported for each of the subcategories of the gender variable (number of males and number of females) was equal to the total number of clients reported (e.g., in question B3a).

The corresponding denominator in these demographic item response rate calculations was the number of facilities reporting that they served clients in a particular setting on April 30, 2010 (i.e., where they reported yes to questions B3, B4, or B5).

**Table D.1. Item response rates for demographic item groups, by setting: 2010**

	Setting		
	Inpatient (%)	Residential (%)	Outpatient (%)
Gender	88.5	94.5	89.2
Age	89.9	93.9	88.0
Ethnicity	81.9	88.5	84.6
Race	79.1	85.0	80.8
Legal Status	84.6	90.8	85.0

## Appendix D

### N-MHSS Editing Methodology

## N-MHSS EDITING METHODOLOGY

The following editing steps were completed after the unrolling process described in Appendix C.

### Editing Steps for Yes/No Questions

The following conventions were used to edit questions containing a list of categories where each required a yes/no response:

- a. If only “yes” responses were reported, then blank responses were coded as “no.”
- b. If only “no” responses were reported, then blank responses were coded as “unknown.”
- c. If a mix of “yes” and “no” responses was reported, then blank responses were coded as “unknown.”
- d. If all categories were left blank, then blank responses were coded as “unknown.”

### Editing Steps for Client Counts

#### A. Editing of Setting Total (inpatient [QB3a], residential [QB4a], and outpatient care [QB5a]) When IP/RC/OPSERV = 1 (QB3 = yes, QB4 = yes, QB5 = yes)

For each setting, all demographic “nonmissing” client count totals (i.e., gender total, age total, ethnicity total, race total, and legal status total) were compared with each other to see how many matched when at least three were reported. If three or more of the five demographic “nonmissing” totals were equal to each other, and the setting total differed from this “majority total,” the setting total was edited to equal the “majority total.”

Given that the respondent completing the survey on the web never saw the demographic totals displayed, it was concluded that, when the sums of what the respondent reported under the demographics often agreed, then this total was more likely to be correct than the one the respondent entered in the setting total box. Such a conclusion would result in the fewest number of revisions to the reported demographic totals.

#### B. Editing of Demographic Client Counts/Percentages Grid (QB3b, QB4b, QB5b) When IP/RC/OPSERV = 1 (QB3 = yes, QB4 = yes, QB5 = yes) for Gender, Age, and Legal Status

##### 1. Editing of Demographic Percentages Grid

For cases in which reported percentages for categories of a demographic group summed to 100 percent, any missing category percentages were edited to zero. Otherwise, all the percentages were edited to blank; complete counts were used to recalculate percentages after the imputation step.

## 2. Editing of Demographic Client Counts Grid when the Setting Total is Reported

- a) **For cases where reported counts for categories of a demographic variable summed to the setting total** (after performing the above step in A), any missing category counts were edited to zero. Reported client counts took precedence over percentages reported; therefore, if counts were reported correctly, percentages were edited to blank to avoid any discrepancies between counts and percentages. Using the client counts, percentages were recreated after completing the imputation step.
- b) **For cases where reported counts for categories of a demographic variable were provided, but did not sum to the setting total, the following rules were applied:**
  - i. **For cases where the reported category percentages summed to 100 percent**, the percentages were applied to distribute the overall total to the respective categories.
  - ii. **For age categories only**, question A12 (“What age categories of clients/patients are accepted for treatment at this facility?”) was used to edit age counts. If a facility reported that it did not accept a particular age group, those age counts were edited to zero.
  - iii. **For cases where reported counts for categories of a demographic variable summed to less than the setting total:**
    - **If only one category had missing client count information**, the count for the missing category was calculated by using the other category counts and the overall total (e.g., if male, but not female counts were provided, female counts were calculated as the difference between the overall total and male counts).
    - **If all categories had provided client counts**, the reported category counts were summed and that sum was used to calculate the proportion of each category. The proportions were applied to the overall total to calculate the counts for each category.
    - **If partial information was provided, that is, only one category count of a demographic variable was reported (e.g., legal status or age)**, the provided category count was retained and the remaining missing categories were imputed.
  - iv. **For cases where reported counts for categories of a demographic variable summed to more than the overall total:**
    - **For gender and legal status**, the reported category counts were summed and that sum was used to calculate the proportion of each category. The proportions were applied to the overall total to calculate the counts for each category.<sup>1</sup>

---

<sup>1</sup> After completion of the above editing steps, the gender category would be devoid of any partial-information cases. All the facilities would have both male and female client counts or would be missing, to be imputed during the imputation step.

□ **For age:**

- If all categories had provided client counts, the reported category counts were summed and that sum was used to calculate the proportion of each category. The proportions were applied to the overall total to calculate the counts for each category.
- If only one count was provided, that category was edited to equal the overall total and all other categories were edited to zero.
- If more than one count was provided, all categories were imputed.

v. **For cases where no client counts were provided, all the client counts were imputed.**

**C. Editing of Demographic Client Counts/Percentages Grid (QB3b, QB4b, QB5b) When IP/RC/OPSERV = 1 (QB3 = yes, QB4 = yes, QB5 = yes) for Ethnicity and Race**

- a) For cases where reported percentages for categories of a demographic variable summed to 100 percent**, any missing category percentages were edited to zero. Otherwise, all the percentages were edited to blank; after completion of the imputation step, complete counts were used to recalculate percentages.
- b) For cases where reported counts for categories of a demographic variable summed to the overall total**, any missing category counts were edited to zero.
- c) For cases where missing or incomplete counts were reported, but the percentages provided summed to 100 percent**, these percentages were applied to the overall total to calculate the counts for each category.
- d) For cases where reported counts for categories of a demographic variable summed to less than the overall total**, the difference between the reported count(s) and the overall total was calculated and that difference was allocated to the “unknown” category.
- e) For cases where reported counts for categories of a demographic variable summed to be more than the overall total**, the reported category counts were summed and that sum was used to calculate the proportion of each category. The proportions were applied to the overall total to calculate the counts for each category, including cases with a mix of reported counts and reported values of zero for one or more categories.

## Appendix E

### Imputation for N-MHSS

## IMPUTATION FOR N-MHSS

Missing data were imputed for the total number of clients and client counts by gender, age, and legal status for each of the three service settings (inpatient, residential, and outpatient). In addition, missing data were imputed for the total number of beds and the total number of admissions.

### Overview of Imputation Methodology

To perform the imputations of the N-MHSS data, sequential multivariate regression imputation was used (Raghuathan et al. 2001), and the calculation was performed using the SAS callable program IVEware. This program creates imputations through a sequence of multiple regressions whereby the imputations are defined as draws from the posterior predictive distribution specified by the regression model with a flat or noninformative prior distribution for the model parameters in the regression model. IVEware appropriately models (given the predictors) the regression of imputed variables that depends on the type of the variable: a normal linear regression for continuous variables, a logistic regression for binary variables, a polytomous or generalized logit regression for categorical variables with more than two categories, a Poisson log linear for count variables, and a two-stage model for a mix of categorical and continuous variables (a zero is treated as a discrete category, and values greater than zero are considered continuous).

The imputations are created on a variable-by-variable basis, conditioned on all observed variables. An imputed variable is modeled by using all other variables as predictors. IVEware first selects the variable with the fewest number of missing cases and regresses it on covariates with no missing values. (IVEware selects the most significant variables as covariates from the list of possible variables included in the imputation model.) The predictions from the regression model become the imputed values for that variable. IVEware then selects the next variable with the second-fewest number of missing cases to be imputed and regresses it on the covariates plus the first imputed variable as predictors. The process then repeats, with predictors in the regression updated every time an imputed variable is imputed from the previous step. By the end of the first round, the process produces a set of data with no missing values.

The imputation process then repeats in rounds 2 through  $c$ , where the regression model for each imputed variable uses predictors that include covariates and all other imputed variables, except the one used as the dependent variable. This step is followed by replacing the previously imputed values with new imputed values and repeats until stable imputed values occur. The sequence of imputing missing values in a cyclical manner, each time overwriting previously drawn values, builds interdependence among imputed values and exploits the correlation structure among variables.

## Imputing N-MHSS Data

The process described above was used to impute missing values of the total number of clients, total number of beds, total number of admissions, and client counts of gender, age, and legal status in the N-MHSS data.<sup>4</sup> Ten regression imputation cycles ( $c = 10$ ) were performed for each variable that was imputed, each time overwriting previously drawn values, building interdependence among imputed values, and exploiting the correlational structure among covariates (Raghunathan et al. 2002).

Certain conditions and boundaries were imposed on the imputation model in order to obtain valid imputation values. Categorical flags were created with values indicating all the possible combinations of provided client counts that a facility reported for a demographic count group.

## Categorical Imputation Flags

### Gender

if male > 0 and female > 0 then gflag = 1

if male > 0 and female = 0 then gflag = 2

if male = 0 and female > 0 then gflag = 3

### Age

if 017 > 0 and 1864 > 0 and 65+ > 0 then aflag = 1

if 017 > 0 and 1864 = 0 and 65+ = 0 then aflag = 2

if 017 = 0 and 1864 > 0 and 65+ = 0 then aflag = 3

if 017 = 0 and 1864 = 0 and 65+ > 0 then aflag = 4

if 017 > 0 and 1864 > 0 and 65+ = 0 then aflag = 5

if 017 > 0 and 1864 = 0 and 65+ > 0 then aflag = 6

if 017 = 0 and 1864 > 0 and 65+ > 0 then aflag = 7

### Legal

if foren > 0 and nonforen > 0 and vol > 0 then lflag = 1

if foren > 0 and nonforen = 0 and vol = 0 then lflag = 2

if foren = 0 and nonforen > 0 and vol = 0 then lflag = 3

if foren = 0 and nonforen = 0 and vol > 0 then lflag = 4

if foren > 0 and nonforen > 0 and vol = 0 then lflag = 5

if foren > 0 and nonforen = 0 and vol > 0 then lflag = 6

if foren = 0 and nonforen > 0 and vol > 0 then lflag = 7

---

<sup>4</sup> Missing values on the race and ethnicity items were not imputed because each of these items had an “unknown” category on the questionnaire and it was assumed during editing that any missing values for these two items belonged to this “unknown” category. The total number of beds item applies only to the inpatient and residential care settings.

These flags were used in the imputation process to indicate which counts in the demographic count group should be imputed. That is, if the gender categorical flag was imputed with a value of 1, then IVEware imputed counts of males and females. If the gender categorical flag was imputed with a value of 2, then IVEware imputed male counts. If the gender categorical flag was imputed with a value of 3, then IVEware imputed female counts. To account for the relationships between variables in the same group (e.g., male and female for the gender group), all variables in the demographic count groups were imputed at the same time.

Some facilities reported counts that were much higher than the 99th percentile of the category's count distribution. These extreme values create problems in imputing missing data because of the potential to impute extremely large values given the posterior distribution. To address this concern, facilities that reported counts of demographic variables above a certain threshold were excluded from the imputation process for modeling. The thresholds were selected after analyzing the distribution of counts and reviewing graphs and distribution plots.

### Outlier Detection: Thresholds

#### Gender

Service setting	Male	Female
Inpatient	1,000	300
Residential	400	150
Outpatient	12,500	4,000

#### Age

Service setting	<18	18-64	65 and older
Inpatient	150	1,250	200
Residential	300	390	30
Outpatient	3,500	7,500	6,000

#### Legal Status

Service setting	Voluntary	Involuntary, non-forensic	Involuntary, forensic
Inpatient	500	750	1,400
Residential	400	250	300
Outpatient	13,000	6,000	1,500

### Number of Facilities Not Included in the Imputation Process (By Setting)

The number of facilities excluded from the imputation process because of outliers is listed below:

### *Inpatient*

Gender - 4 facilities (0.2%)

Age - 4 facilities (0.2%)

Legal Status - 3 facilities (0.2%)

### *Residential Care*

Gender - 2 facilities (0.09%)

Age - 3 facilities (0.13%)

Legal Status - 3 facilities (0.13%)

### *Outpatient*

Gender - 2 facilities (0.03%)

Age - 3 facilities (0.04%)

Legal Status - 28 facilities (0.36%)

Each treatment setting (IP, RC, and OP) was imputed separately. The following steps describe the imputation process:

- *Step 1.* Using IVEware, the categorical flags were imputed for gender, age, and legal status. The possible covariates included all variables in Section A of the questionnaire, the total number of clients, the total number of beds (IP and RC settings only), and all the demographic count variables (excluding ethnicity and race). Step 1 did not yet impute the count, but instead imputed the flag variable (e.g., whether the facility reported both male and female counts or only male or female counts).
- *Step 2.* In the first step, the software automatically imputed any missing value it encountered among the possible covariates in the data set. For the software to select the best possible model, it included totals and gender, age, and legal status variables from the previous step. Total client counts, total beds (IP and RC settings only), and the demographic count variables would be imputed by using their corresponding categorical flags with a different set of possible covariates in later steps; therefore, the imputed values for these variables were manually edited back to “missing.”
- *Step 3.* After manually editing total client counts, total beds, and demographic count variables back to the original missing values, imputation proceeded for total client counts, total beds (for IP and RC settings only), and total number of admissions. Counts broken down by demographic count variables were not included as possible covariates because the imputation of such variables would use the total number of clients (reported or imputed). The lower bound for the imputed values was set to not less than zero.
- *Step 4.* Using the newly imputed values for total client counts, this step edited the missing counts for ethnicity and race (groups that were not imputed). If a facility originally provided category percentages that summed to 100 percent, then those percentages were used to distribute the

imputed total number of clients to the respective ethnicity or race categories. If a facility did not provide percentages, then the imputed total number of clients was allocated to the unknown category. The unknown category percentage was edited to 100 percent and all other categories to 0 percent. Counts were adjusted for rounding error to coincide with the total client count.

- *Step 5.* The data set (now including imputed values for the categorical flags and total variables) was subdivided into three smaller data sets: gender, age, and legal status. Each data set contained Section A responses, the total client count, the total number of beds (IP and RC settings only), and the respective demographic count variables and categorical flags. Outliers were removed from each of the three data sets. The removed facilities were not used for imputation because, as stated earlier, IVEware could potentially impute extremely large values.
- *Step 6.* Using the new gender-specific subset created in Step 5, gender variables were imputed. The imputation of male and female counts was restricted given the value of the categorical flag; IVEware automatically imputed a zero in a category if the flag indicated that the category had no counts. Bounds for the imputed value were greater than zero (unless specified by the flag) and less than or equal to the total number of clients.
- *Step 7.* Using the age-specific subset created in Step 5, age variables were imputed. The imputation of age counts was restricted given the value of the categorical flag; IVEware automatically imputed a zero in a category if the flag indicated that the category had no counts. Bounds for the imputed value were greater than zero (unless specified by the flag) and less than or equal to the total number of clients.
- *Step 8.* Using the legal-specific subset created in Step 5, legal status variables were imputed. The imputation of legal status counts was restricted given the value of the categorical flag; IVEware automatically imputed a zero in a category if the flag indicated that the category had no counts. Bounds for the imputed value were greater than zero (unless specified by the flag) and less than or equal to the total number of clients.

### **Post-Imputation Editing**

Because IVEware imputes the demographic variables individually, it was not possible to restrict the imputed values of a demographic group so that the sum of the count variables (such as male and female added) equaled the total number of clients (reported or imputed). Therefore, it is possible that the sum of the demographic variables, using both imputed and original values, did not equal the total number of clients. Accordingly, it was necessary to prorate the imputed values manually by calculating their proportions to match the total number of client counts. Editing was needed in three possible scenarios:

- Some facilities provided category percentages that summed to 100 percent. Those percentages were used to distribute the total number of clients to the respective categories. Counts were adjusted for rounding error so that they summed across categories to the total client count.
- During the editing process, any partial-count information was kept if it was less than the total number of clients, and the two categories with missing values were imputed (only applies to age and legal status). To adjust the imputed counts so that all three categories sum to the total number of clients, the two imputed categories were first summed, and then the proportion of each of the two imputed categories was calculated. Next, these proportions were applied to the

difference between the total number of clients and the originally provided count to calculate the number of clients in each imputed category. The client counts in each category then summed to the overall setting total. Counts were adjusted for rounding error.

- The remaining imputed cases were prorated back to sum to the total number of clients. The imputed client counts were summed, and this sum was used to calculate the proportion of counts in each category. These proportions were then applied to the overall setting total number of clients to calculate the number of clients in each category. The client counts in each category then summed to the overall setting total. Counts were adjusted for rounding error.

## **Merging Data Sets**

After the manual edits were completed for the individual gender, age, and legal status data sets, a multistep process was used to merge all the data sets. First, each individual data set was merged with those cases excluded from the imputation process because of outliers. Second, the gender, age, and legal status data sets were merged. Third, the combined gender, age, and legal status data set was merged with the data set containing the imputed total counts of clients, beds, and admissions (full data set before Step 5 above). This process was repeated for the data sets for each treatment setting (IP, RC, and OP). In the last step, the three treatment setting data sets were merged to create the final data set.

After creation of the fully imputed data set, missing percentages had to be recreated by using the observed and imputed client counts. Unless percentages that added to 100 percent were provided, the percentage values, if provided, were blanked out during the editing step or not provided at all; therefore, the values had to be calculated based on the reported or imputed number of clients. The percentages were then adjusted for rounding errors so that they summed to 100 percent across categories within a demographic variable.

## **Adjusting for Rounding Errors**

Once the missing values were edited and imputed, an adjustment for rounding errors was needed as client count proportions were used to make the demographic category sums equal the total reported (or imputed) client counts in the facility. The following steps were used to correct rounding errors:

- The rounding adjustment edit started the adjustment with the category in each group (gender, age, legal status) with the overall largest number of clients provided, followed by the category with the second-largest number of clients provided until the last category was reached. For example, overall, the number of male clients reported was larger than the number of female clients reported; therefore, the adjustment of rounding error would be performed first on the male client counts. If no male counts were reported (or imputed) for the facility, then the rounding adjustment was performed on the female counts.
- The difference was calculated between the total number of clients and the sum of the counts of the categories in each demographic group (for example, total number of clients reported by the facility minus the sum of total number of males and total number of females).
- The selected category in Step 1 (category with overall majority) was adjusted by the difference determined in Step 2. If the selected category had no counts reported (or imputed) or the count in the category was less than the difference calculated, then the category with the second-largest

count was edited. For example, if the sum of males and females was one client greater than the total client count, the one client was subtracted from the male category as long as males had at least one client reported (or imputed).

### **Data Analyses and Final File**

Given that this N-MHSS report does not include comparisons and tests for statistical differences, it does not contain any standard errors for the point estimates presented.
